## Coding Projects

**CRAN package** During my 2012 sabbatical I wrote an R data mining package for discovering non-linear associations between variables in a dataset. Read <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0151551> for further details.

**Deep Learning with Julia** During 2018 I developed a textbook that teaches Deep Learning using the Julia computing ecosystem. The current version of the text is available online <https://hughmurrell.github.io/DeepLearningNotes/index.html>.

**Covid-19 tracking** During 2020, I constructed a Julia script to compute  $R_t$  estimates at scale from global data sets. This script updates nightly and allows users to compare Covid outbreaks from region to region. Results can be viewed here; <https://reproduction.live/world>

**PacBio Pipeline** In July 2021, I started supporting a high throughput PacBio pipeline that performs demultiplexing, filtering and UMI analysis to obtain sequence populations from HIV patients. The pipeline is composed of Julia scripts running under **SnakeMake**. Initially

the client was Carolyn Williamson from the HIV Diversity and Pathogenesis Group at UCT. Later, James Mullins from the University of Washington, Seattle and Morgane Rolland from the viral genomics section of US military HIV research programme (MHRP) in Washington joined my customer base.
